

For this assignment you need to use the Alexamara tables you created for an earlier assignment. You are to write a c++ program that will list each marina (the appropriate information), then under that each owner first and last name and city, then under each owner list each boat, and under each boat list all of the service requests (description and status).

Use your own good judgment about how to organize your code and your output. Use appropriate documentation. Any code that the TA or instructor feels does not have adequate documentation will receive a 0.

Turn in the source code and output on Blackboard. Your TA or instructor may actually run your program.
